Slavomír Tuleja's POSTER from the AAPT Topical Workshop
Teaching General Relativity to Undergraduates
 Held at Syracuse University, July 20-21, 2006

Slavomír Tuleja

An interactive JAVA program plots orbits of test particles and light flashes in the equatorial plane of a non-spinning (Schwarzschild) and a variable-spin (Kerr) black hole. The software displays either the time-development of an orbit or the entire orbit over extended time. In the latter case the orbit changes instantly and continuously as the operator varies initial conditions. For the spinning Kerr black hole, the display shows the ergosphere (in which no particle can remain at rest) as well as the outer horizon and inner (Cauchy) horizon. The operator can use alternative global coordinate systems appropriate to the given black hole: Schwarzschild, Boyer-Lindquist, Gullstrand-Painlevé, and Doran. The interactive time-dependent display complements the static, analytic presentation of textbooks.
